Problem (Make Avg) - Generate examples

Now that we have understood the problem statement, let us write down a few more sample cases or examples. Review the sample input / output given in the table below.

Sample 1:

Input	Output
6 inputs as follows 1 1 1 2 1 3 1 4 2 2 2 3	6 outputs as follows 1 -1 2 -1 2 -1

Did you like the problem?
251 users found this helpful

Select multiple options as applicable.

- [x] For A = 3 and C = 4, the output is -1
- [ ] For A = 3 and C = 4, the output is 2
- [ ] For A = 3 and C = 5, the output is 4
- [ ] For A = 2 and C = 4, the output is 3
- [ ] For A = 3 and C = 5, the output is -1
- [ ] For A = 2 and C = 4, the output is 2

Problem (Make Avg) - Solve sub-components

Given the integers A and C - how do we find their average - the integer B?
Code this sub-problem in the IDE to continue.

Python3

```python
# How to find the average of 2 numbers?

A = 15
C = 19
B = (A + C)//2
print(B)

A = 16
C = 18
B = (A + C)//2
print(B)
```

Your Output

```
17
17
```

Awesome, you nailed it!

Statement Help

Problem (Make Avg) - Solve sub-components

How do we check the following?

- Are both A and C odd?
- Are both A and C even?
- Is A odd and C even or vice versa?

Code this sub-problem in the IDE to continue.

71 users found this helpful

Rearrange the following code

```
if A%2 == 0 and C%2 == 0:
    print('Both A and C are even')
elif A%2 != 0 and C%2 != 0:
    print('Both A and C are odd')
else:
    print('A is odd and C is even or vice versa')
```

Awesome, you nailed it!

See Answer Hide Solution

```
if A%2 == 0 and C%2 == 0:
    print('Both A and C are even')
elif A%2 != 0 and C%2 != 0:
    print('Both A and C are odd')
else:
    print('A is odd and C is even or vice versa')
```

Statement Submissions Solution AI Help

Problem (Make Avg) - Solve the complete problem

You are given 2 integers - A and C.

You need to find if there exists any *integer* B which meets the following condition

- B must be an integer
- B is the average of A and C.

Input Format

- The first line of input will contain a single integer T, denoting the number of test cases.
- Each test case consists of two space-separated integers A and C, the given integers.

Output Format

For each test case, output -1 if there exists no integer B such that A, B, and C are in arithmetic progression. Else, output the value of B.

Sample 1:

Input	Output
3 3 5 6 6 2 7	4 6 -1

Explanation:

Test case 1: Considering $B = 4$. B is the average of 3 and 5.
Test case 2: Considering $B = 6$. B is the average of 6 and 6.
Test case 3: There exists no integer B such that B can be the average of 2 and 7.

Python3

```python
# Solution as follows

t = int(input())
for i in range(t):
    A, C = map(int, input().split())

    #Borrow the solution template from the sub-components
    if A%2 == 0 and C%2 == 0:
        B = (A + C)//2
        print(B)
    elif A%2 != 0 and C%2 != 0:
        B = (A + C)//2
        print(B)
    else:
        print(-1)
```

Test against Custom Input

```
3
3 5
6 6
2 7
```
